Transportation of tools, materials, equipment via vehicles is quite common in industrial operations; however lack of knowledge, specifications as well as hastiness and poor vehicle maintenance contribute to accidents that may result in tragic events.

In the following, one can observe unsafe cargo transportation malpractices:

Poorly maintained vehicles are often observed on the streets worldwide

- School bus with worn out tires in the USA
- No comment
- Poorly maintained pickup truck (the registration plate indicates it is a State-owned vehicle) in Greece

Balancing the loads is not enough for a safe transportation;
securing the cargo following the laws of physics is equally
important
